

Siviens has developed the process for restoring UV damaged signage. Siviens' process also deters UV damage in newer signage and prevents or deters mold growth on signs.

Technology:

- Siviens' process treats the surface level of retroreflective sheeting as well as subsurface-level prisms and microprisms, correcting damage and preventing future damage resulting from age and/or UV Rays.

Capabilities:

- Siviens restores signage at the signs' location
- Annual treatments recommended
- Siviens can provide the service or sell the product to be applied by your personnel
- Reflective, retroreflective and flat-paint can be restored if treated before too much damage is sustained

Past Performance Contact:

V.A. - Wilmington, NC
P.O.C. - Lauren Torres
Email: lauren.torres@va.gov

Differentiators:

- Siviens' process saves funding by restoring signs versus costly replacement
- New and older signage can remain retroreflective indefinitely with annual treatments
- Signs will remain bright and vibrant, enhancing visibility, increasing and sustaining public safety

Past performance:

- Veterans Administration - Wilmington, NC
- This is a formula created and sold since 2010 (14 years).
- Siviens' process was applied to signs that were non-retroreflective, which were restored and remained retroreflective at 1700 feet 13 months after treatment
- Signs with significant mold growth have remained mold-free 13 months
